

A Strawberry Story

Cut out and stick these events in the right order.

Holes are made in the plastic and the strawberry seeds are planted into them. The plastic is like a warm blanket, which helps the plant to grow. Some farmers grow their strawberries in tunnels to keep the plants as protected as possible from the elements.

These are sold in supermarkets or at local markets.

Soil mounds (beds) are created in the field using a bedformer.

Once red, the strawberries are ready to be picked by hand and put into punnets (small containers).

These beds are then covered with plastic.

The white flowers die and strawberries begin to grow in their place.
